***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12/1/03 has been entered.
2. The amendment filed 12/1/03 has been considered and entered. Claims 10,20 and 28 have been canceled. Claims 1-9,11-19,21-27 and 29 remain in the application. The Obviousness-type Double Patenting rejection has been withdrawn.
3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-9,11-19,21-27 and 29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wang (5,733,685).

Wang (5,733,685) teaches a method of treating lithium manganese oxide spinel that involves heating the lithium manganese oxide spinel in an atmosphere of an inert gas that does not react with the spinel. The spinel is coated with a hydroxide, preferably lithium, sodium or potassium and then heated in an atmosphere of inert gas at elevated temperatures (abstract and col. 4, line 40 – col. 9, line 50).

Wang (5,733,685) fails to teach heating the coating lithium compound while in the mixture.

Dahn et al. (4,959,282) teaches a cathode active material for electrochemical cells whereby manganese particles are coated with a lithium compound in a mixer and during agitation a drying step is performed simultaneously.

Therefore, it would have been obvious for one skilled in the art at the time the invention was made to have modified Wang (5,733,685) process by drying/heating in the mixer as evidenced by Dahn et al. (4,959,282) with the expectations of achieving similar success.
